

AI Annotation Model (for Systems, Architectures, and Methods)

For each question, answer **YES** or **NO** based on whether the statement applies to the system, architecture, or method described in the text. Answer **N.A.**, when you are not sure about your answer on the basis of the text.

If the text describes:

- **A single agent system**, answer based on what the system itself does.
- **If it is a multi-agent system**, answer based on what the agents that are part of this system can do.
- **An architecture, framework, method, etc.**, answer based on whether it **enables agent systems (whether individual or multi)** to meet the criteria.
 - This is always the final sub question for each question.

0. Is the focus of the text on an agent system?

1. Embeddedness in the Environment

- A. Does the text explicitly mention that the agent system can act/perform an action?
- B. Can the state of the environment change independently of what the agent system does?
- C. (If the text describes an architecture, framework, or method:) Does the text explicitly mention that agent systems can act/perform actions?

2. Defining the Environment (Please answer all questions)

- A. Does the text explicitly mention a digital/simulated/game environment?
- B. Does the text explicitly mention that the agent system can control a physical computing device (e.g. a robot) in a physical/simulated world?

3. Autonomy & Purpose

- A. Can the agent system take actions/behave/do things without direct external control?
- B. Does the agent system act based on a purpose (e.g., goals, tasks, objectives)?
- C. (If the text describes an architecture, framework, or method:) Does the text explicitly mention that agent systems can do things autonomously/independently/by themselves or that they act according to an individual reward?

4. EHAR Framework (Environment, History, Adaptive Repertoire)

- A. Does the agent system have a memory?
- B. Does the text explicitly refer to the agent system as having a (physical/simulated) body?
- C. Is the agent system always restricted to a specific set of actions?
- D. Does the agent adapt its behavior based on what it has done and learned before?
- E. (If the text describes an architecture, framework, or method:) Does it support agent systems in adapting their behavior based on what they have done and learned before?

5. Purpose & Goal Formation

- A. Does the text explicitly mention that the agent system can formulate its own plan/sub steps on how to achieve its purpose?
- B. (If the text describes an architecture, framework, or method:) Does the text explicitly mention that agent systems can form their own plans or can achieve their task/goal/purpose based on plans or sub steps they have formulated themselves?
